

# Team Status Report #3

**Group members:** Christina Sarkisyan, Ethan Dorta, Joseph Strickland, Lolo Aboufoul, Zaina Shawar

- **Goals from Previous week**

- Agree on more concrete meeting times outside of class
- Figure out which tasks need to be completed in what order
  - Assign these out to individuals
- Data flow charts completed/ agreed upon
- Get a working prototype ready (roughest version)
  - Need to decide which features to add to this prototype
    - Likely bare minimum is the drafts or rough pages to be navigated to and potentially some links
- Updated and organised backlog
- Come up with a rough schedule of which order we want to do things in and when they should be completed

- **Weekly Progress: what you've done, what worked, what you learned, where you had trouble, and where you are stuck.**

This week we finished the data flow charts and agreed on how to organize them. We discussed them as a group and then split apart to complete the attributes diagrams. We also worked on making a more refined prototype. Some team members worked on adding more features to the lo-fi diagrams. One specific task we worked on this week was understanding how databases work and how information for our software will come from various databases.

- **Plans and goals for upcoming week (4/5-4/9)**

This week, we plan on applying our user stories and try to apply the features we have individually described as part of each user story. This will involve coding and creating files that are able to be tested and will require application of what was learned from previous Flask tutorials. We will also work on organizing our presentation and seeing who is comfortable with presenting each part of our software. Finally, the backlog will continue to be updated with all changes made in the next sprint.

**Agenda for next meeting**

- Begin coding files that will create software
- Apply all basic features and add some detailed features
- Apply user stories to better create the software to fit all potential users' needs

- Decide what further features need to be applied to our final product
- Work on presentation; organize sections to be presented; potentially assign each team member a section
- Update backlog with all necessary information/changes
